AP20 Rec'd DPTO 02 MAY 2006

A seat back panel for a fold flat seat assembly comprises a panel attached to a seat back for elevating stored objects within a vehicle above a seat back when the seat back is in a folded flat position. An opening within the panel receives objects and retains them between the seat back and the seat panel. The panel includes hooks for holding hanging items within the vehicle. The hooks are only operable when the seat back is in the folded flat position for preventing interference with an airbag disabling system utilizing weight sensors.
